FOR CUSTOMER TABLE

Single-Row Text / String Functions

- **Question 1**: Display a list of all customers showing their customer_id and their gender in all uppercase letters (e.g., MALE, FEMALE).
- **Question 2**: Generate a temporary mailing label format by combining customer_id and city separated by a hyphen (e.g., "C0001 - Liverpool").
- **Question 3**: Find all customers whose city names are exactly 6 characters long.
- **Question 4**: Extract and display just the first 3 characters of the city column for every customer profile.

Single-Row Numeric / Math Functions

- **Question 5**: Assume every customer will have a birthday next month. Display the customer_id and their age incremented by 1.
- **Question 6**: Categorise ages into decade blocks by dividing the age by 10 and using a function to truncate or round down to the nearest whole integer.
- **Question 7**: Calculate the absolute difference between each customer's age and the retirement age benchmark of 65.

Single-Row Date Functions

- **Question 8**: Display the customer_id along with the specific year and the specific month name extracted from their signup_date.
- **Question 9**: Find all customers who signed up specifically during the year 2023.
- **Question 10**: Calculate approximately how many days have passed between a customer's signup_date and the current modern date.
- **Question 11**: Find all customers who registered in the final quarter (October, November, or December) of any calendar year.

ORDER TABLE

Single-Row Text / String Functions

- **Question 1**: Write a query to display all order_id values alongside their payment_method converted entirely to lowercase characters (e.g., "card", "cash").
- **Question 2**: Format a summary reference string by combining the prefix 'ID-' with the customer_id and the suffix '-ORD' (e.g., "ID-C0692-ORD").
- **Question 3**: Find all unique purchase records where the length of the string in the payment_method column is exactly 4 characters long.
- **Question 4**: Clean up lookups by extracting just the numeric digits from the product_id column by removing the leading 'P' character.

Single-Row Numeric / Math Functions

- **Question 5**: Assume a business restructuring doubles item allocations. Display each order_id along with its quantity multiplied by 2.
- **Question 6**: Write a mathematical query evaluating the remainder (modulus) of the quantity when divided by 2 to determine if an odd or even amount of items was ordered.
- **Question 7**: Calculate the exponential value of the quantity column squared (quantity^2) for a volume variance metric.

Single-Row Date Functions

- **Question 8**: Extract and display the specific calendar day of the week name (e.g., Sunday, Monday) on which each order was placed using the order_date.
- **Question 9**: Find all customer order rows where the transaction took place specifically in the calendar year 2024.
- **Question 10**: Write a date logic query that calculates exactly how many full months have elapsed between the historic order_date and the current date.
- **Question 11**: Proactively calculate a delivery ETA column by writing an expression that adds exactly 5 business days to each transaction's order_date.
